

Solstice Outdoor Co.

GA4 and Google Tag Manager implementation - evidence pack

A demo e-commerce storefront instrumented end to end: a tracking plan designed from stakeholder questions, implemented through GTM, validated at the network layer, analysed in GA4 Explore, and reported in Data Studio.

Site	gleeful-hotteok-0eadaa.netlify.app
GTM container	GTM-W48BV4SP - 17 tags, 13 triggers, 16 variables, 5 folders
GA4 property	Solstice Outdoor Co. (G-47X3FGWN78)
Capabilities	E-commerce tracking - paid ads conversions - engagement metrics - Consent Mode v2 - UTM lead scoring
Reporting	GA4 Explore (funnel, segment comparison) and Data Studio

Scope note: this is a demo storefront with no backend, no real payments and no real orders. The baseline dataset was seeded via the GA4 Measurement Protocol and supplemented with real click-through sessions. The implementation and the analysis method are the point, and both transfer directly to production data.

Container structure: 17 tags across five capability folders

The full tag list for container GTM-W48BV4SP. Tags are organised into five folders, one per capability: GA4 e-commerce, paid ads conversion tracking, engagement metrics, cookie consent, and lead scoring. Every tag shows its type and the trigger that fires it.

Worth noting: the folder structure maps to five stakeholder questions, not five GTM features. Consent - Set Defaults fires on Consent Initialization - All Pages, which GTM guarantees runs before every other tag in the container.

The screenshot displays the Google Tag Manager interface for container GTM-W48BV4SP. The left sidebar shows the 'Tags' tab selected. The main area lists 17 tags, organized into five folders. The tags are categorized by type and their firing triggers.

Name	Type	Firing Triggers	Folder	Last Edited
Consent - Set Defaults (Denied)	Custom HTML	Consent Initialization - All Pages	4. Cookie consent (Consent Mode v2)	2 minutes ago
Consent - Update on Accept	Custom HTML	Consent Update - Accept	4. Cookie consent (Consent Mode v2)	9 hours ago
Consent - Update on Reject	Custom HTML	Consent Update - Reject	4. Cookie consent (Consent Mode v2)	9 hours ago
GA4 Configuration - Base Tag	Google Tag	Page View - All Pages	1. GA4 e-commerce	9 hours ago
GA4 Event - Add Payment Info	Google Analytics: GA4 Event	Custom Event - add_payment_info	1. GA4 e-commerce	9 hours ago
GA4 Event - Add to Cart	Google Analytics: GA4 Event	Custom Event - add_to_cart	1. GA4 e-commerce	9 hours ago
GA4 Event - Begin Checkout	Google Analytics: GA4 Event	Custom Event - begin_checkout	1. GA4 e-commerce	9 hours ago
GA4 Event - Engagement Click	Google Analytics: GA4 Event	Click - Tracked Buttons	3. Engagement metrics	9 hours ago
GA4 Event - Form Submission	Google Analytics: GA4 Event	Form Submission - All Forms	3. Engagement metrics	9 hours ago
GA4 Event - Generate Lead	Google Analytics: GA4 Event	Custom Event - generate_lead	5. Lead scoring (UTM + CRM)	9 hours ago
GA4 Event - Purchase	Google Analytics: GA4 Event	Custom Event - purchase	1. GA4 e-commerce	9 hours ago
GA4 Event - Scroll Tracking	Google Analytics: GA4 Event	Scroll Depth - 25/50/75/90%	3. Engagement metrics	9 hours ago
GA4 Event - View Item	Google Analytics: GA4 Event	Custom Event - view_item	1. GA4 e-commerce	9 hours ago
GA4 Event - View Item List	Google Analytics: GA4 Event	Custom Event - view_item_list	1. GA4 e-commerce	9 hours ago
Google Ads Conversion - Lead Form Submit	Custom HTML	Custom Event - generate_lead	2. Paid ads conversion tracking	9 hours ago

The URL at the bottom of the screenshot is: https://tagmanager.google.com/?utm_source=marketingplatform.google.com&utm_medium=et&utm_campaign=marketingplatform.google.com%2Fabout%2Ftag-manager%2F#/container/accounts/6368101499/containers/259437667/workspaces/5/tags/42

Container published live: 17 tags, 13 triggers, 16 variables

Version 4 published to production. The version history shows the container's progression from an empty container through to the current live build.

Configured is not the same as published. A container that has never been submitted does nothing on the live site, so the published version banner is the proof that matters.

Full purchase funnel firing on the live site

Tag Assistant output from a live click-through: View Item List, View Item, Add to Cart, Begin Checkout, Add Payment Info and Purchase all fired, alongside Scroll Tracking (25 fires) and the GA4 configuration tag (8 fires).

Tags Not Fired is equally informative. Generate Lead, Engagement Click and the consent update tags did not fire because that user journey did not include a form submission, a tracked link click, or a banner interaction. Correct behaviour, not a gap.

Requests reaching GA4: seven hits, all status 204

Browser network panel filtered to the GA4 collect endpoint. Seven requests to measurement ID G-47X3FGWN78, every one returning 204 - the correct success response for GA4 collection.

Tag Assistant proves the tag executed. It does not prove the request reached Google. Checking the network layer separates a JavaScript problem from a delivery problem, which is the difference between debugging GTM and debugging an ad blocker.

The screenshot shows a web browser window displaying the Solstice website. The Chrome DevTools Network panel is open, showing a list of network requests. The filter 'collect' is applied, and seven requests to the GA4 collect endpoint are visible, all with a status of 204.

Name	Status	Type	Initiator	Size	Time
collect?v=2&tid=G-47X3FGWN78&g...	204	fetch	js?id=G-47X3FGWN7	0.0 kB	50 ms
collect?v=2&tid=G-47X3FGWN78&g...	204	fetch	js?id=G-47X3FGWN7	0.0 kB	50 ms
collect?v=2&tid=G-47X3FGWN78&g...	204	fetch	js?id=G-47X3FGWN7	0.0 kB	52 ms
collect?v=2&tid=G-47X3FGWN78&g...	204	fetch	js?id=G-47X3FGWN7	0.0 kB	50 ms
collect?v=2&tid=G-47X3FGWN78&g...	204	fetch	js?id=G-47X3FGWN7	0.0 kB	50 ms
collect?v=2&tid=G-47X3FGWN78&g...	204	fetch	js?id=G-47X3FGWN7	0.0 kB	51 ms
collect?v=2&tid=G-47X3FGWN78&g...	204	fetch	js?id=G-47X3FGWN7	0.0 kB	107 ms

At the bottom of the DevTools window, a summary bar shows: 7 / 43 requests, 0.1 kB / 429 kB transferred, 0.0 kB / 2,446 kB resources, and a finish time of 1.4 min.

In the background, the Solstice website is visible, showing a product page for a 'Traverse Hiking Boot'. A Tag Assistant notification is also present, stating 'Tag Assistant Connected' and 'Debug Information for this page is viewable in the Tag Assistant window'.

Purchase funnel: where the drop-off actually happens

Four-step funnel built in GA4 Explore from the instrumented dataLayer events. 154 users viewed a product, 44.2% added to cart, 14.9% began checkout, and 13% purchased.

The leak is add_to_cart to begin_checkout, roughly 66% abandonment. Completion after checkout starts is high, so the checkout form is not the problem - getting people into it. The next step is a hypothesis list, then segmenting the funnel by device and channel before proposing any fix.

Purchasers versus cart abandoners, side by side

Two user-scoped segments compared in a free form exploration: users who triggered a purchase, and users who added to cart but never purchased. Broken out by acquisition medium.

Purchasers show a real channel spread - affiliate, cpc, email, paid social. Abandoners sit almost entirely in unattributed traffic, which is a data-quality finding in itself rather than a behavioural one. A segment like this doubles as a remarketing audience, so the analysis and the activation share one definition.

Funnel visualisation and event-level detail

Page one of the Data Studio report, connected live to the GA4 property. The funnel chart covers all eight instrumented events, with the supporting table showing event counts and sessions for each.

Sessions and event count are identical for the e-commerce events because each fires once per session by design. Where they diverge - scroll depth, page views - that is the signal the event repeats within a single session.

Active users and event volume in the GA4 property

The GA4 home view showing 200 active users and 726 events across the reporting window, with the traffic spike corresponding to the seeded baseline.

City-level data is empty here because Measurement Protocol events do not carry the geo and device signals a real browser session sends. Saying that before someone asks reads better than being caught by it.

Channel mix by first-user attribution

Active users broken out by first user source / medium: direct 180, google/cpc 9, klaviyo/email 5, trailgear/affiliate 4, facebook/paid_social 2, all captured through UTM-tagged test links.

This reports first-touch user attribution rather than session-scoped attribution. Session source was unreliable in this dataset because the baseline was seeded via Measurement Protocol, which does not originate session-scoped source and medium. Reporting on the scope the data supports, and naming why, is the honest read.
